## 二、阅读理解(30分)

### Reading Comprehension

Passage:

The following is an extract from a science magazine about the discovery of a new form of light,which has the potential to revolutionize various fields such as communication and lighting.

In the small mountain town of Isers,nestled near the edge of a vast,lush forest,a team of scientists from Oxford University has made a breakthrough that could redefine our understanding of light.The team,led by Dr. Evelyn Chang,has successfully created a new form of light that is not only visible to the human eye but also emits sound waves.This dual property of the new light,which they have named“photon wavelength synthesis”(PWS),has led to兴奋和期待。

Dr.Chang and her colleagues explain that PWS light is a result of

coalescing two different types of photons—visible and infrared—into a single, coherent beam. This beam of light, when projected, can be both seen and heard due to its ability to produce sound waves. This innovative technology has numerous practical applications.

One of the most exciting applications is in augmented reality (AR). By incorporating PWS into AR devices, the experiences of users could be dramatically enhanced. Imagine using a smartphone to interact with the real world, where objects not only appear before your eyes but also emit various sounds based on their function or characteristics.

Another potential use for PWS light is in medical scanning. Traditional scanning methods often involve high radiation levels. However, with the use of PWS light, doctors can perform detailed scans without exposing patients to the same level of radiation. This could lead to earlier diagnosis and treatment of various conditions.

Dr. Chang concludes, “The discovery of PWS light is a significant leap forward for science. Its applications are vast and its potential groundbreaking for many fields. We are just beginning to explore the possibilities.”

Questions:

**1. What is the main discovery made by the Oxford University scientists?**

A. A new form of light that is visible and emits sound waves.

B. A method to create visible and infrared light simultaneously.

C. A new way to enhance the functionalities of augmented reality devices.

D.A new type of medical scanning without radiation.

2.According to the passage,how could PWS light benefit medical scanning?

A.It would eliminate the need for radiation completely.

B.It would reduce radiation exposure for patients.

C.It would improve the diagnosis of various conditions.

D.It would allow for scanning without the use of any form of light.

3.Which of the following is NOT mentioned as a potential application of PWS light in the passage?

A.Improved lighting systems.

B.Enhanced communication technology.

C.Detailed medical scanning.

D.Enhanced augmented reality experience.

Answers:

1.A

2.B

3.A
